# Índice de Contenidos

---

## Sesión 1: Procesos de Negocio - Chair: Dr. Pedro Álvarez

---

On the definition and design-time analysis of Process Performance Indicators. <i>Adela Del-Río-Ortega, Manuel Resinas, Cristina Cabanillas and Antonio Ruiz-Cortés</i> .....	13-14
Automated Resource Assignment in BPMN Models Using RACI Matrices. <i>Cristina Cabanillas, Manuel Resinas and Antonio Ruiz-Cortés</i> .....	15-16
DecisionMaking Sub-Process to Obtain the Optimal Combination of Input Data in Business Processes. <i>Luisa Parody, María Teresa Gómez-López and Rafael M. Gasca</i> .....	17-31

---

## Sesión 2: Servicios Inteligentes - Chair: Dr. Juan Pavón

---

Integración del Internet de las Cosas y las Arquitecturas Orientadas a Servicios: un Caso de Estudio en el Ámbito de la Domótica. <i>Juan Boubeta-Puig, Guadalupe Ortiz and Inmaculada Medina-Bulo</i> .....	35-49
Towards cloud-enabled mobile device and applications. <i>Javier Miranda, Joaquín Guillén Melo, José Javier Berrocal Olmeda, José Manuel García Alonso, Juan Manuel Murillo Rodríguez and Carlos Canal</i> .....	51-65
Diseño de una caché de objetos para servicios del tipo RTVE a la carta. <i>Manuel Gómez Zotano, Juan Pavón and Jorge Gomez-Sanz</i> .....	67-79
Un caso de Estudio para la Adaptación de Servicios Web al Dispositivo. <i>Guadalupe Ortiz Bellot, Sonia Peinado Cruz and María Jesús Rodríguez Sánchez</i> .....	81-94

---

## Sesión 3: Métodos y Servicios Intensivos de Conocimiento - Chair: Dr. Francisco Ruiz

---

GEPRODIST: Gestión de proyectos y desarrollo de software de forma distribuida. <i>José García-Alonso, Jose Javier Berrocal Olmeda, Fernando Hernández and Juan Manuel Murillo Rodríguez</i> .....	97-102
The Role of KISA in Basic Agro-food Processes Innovation: the Case of Orange Packers in Eastern Spain. <i>José Albors</i> .....	103-104
Aplicación de un Proceso de Desarrollo Orientado a Servicios y Dirigido por Modelos en el Ámbito Sanitario. <i>Marcos López Sanz, María Valeria De Castro and Esperanza Marcos</i> .....	105-119
Externalización de servicios de TI en el sector público: análisis de un caso de política pública de homologación de proveedores en la Generalitat de Catalunya. <i>Josep M. Marco-Simó, Joan A. Pastor and Rafael Macau</i> .....	121-135

---

## Sesión 4: Verificación y Semántica de Servicios - Chair: Dra. María Valeria de Castro

---

Una arquitectura para la evaluación de la calidad de las reglas de monitorización de composiciones WS-BPEL. <i>Antonio García-Domínguez and Inmaculada Medina-Bulo</i> .....	139-146
Towards Run-Time Verification of Compositions in the Web of Things using Complex Event Processing. <i>Javier Cubo, Laura González, Antonio Brogi, Ernesto Pimentel and Raúl Ruggia</i> .....	147-154
Análisis y especificación de propiedades en prueba metamórfica para WS-BPEL. <i>M. Carmen De Castro and Inmaculada Medina-Bulo</i> .....	155-162
Una experiencia real de anotación semántica a gran escala utilizando recursos de computación heterogéneos. <i>Sergio Hernández, Estefanía Otero, Javier Fabra, Juan Carlos Vidal, Manuel Lama and Pedro Álvarez</i> .....	163-177

# On the definition and design-time analysis of process performance indicators\*

## Summary of the contribution

Nowadays, organisations face the challenge not only to effectively and efficiently perform their business processes, but also to improve them to adapt to new requirements imposed by a continuously changing market. A key aspect to identify the improvement points is to conduct a performance management, which involves appropriately defining PPIs (Process Performance Indicators).

After a thorough review of the literature related (e.g. [1–3]) and a study of the current picture in different real organisations, we conclude that there not exists any proposal that allows the definition of PPIs in a way that is unambiguous and highly expressive, understandable by technical and non-technical users and traceable with the business process (BP). Furthermore, it is also increasingly important to provide these PPI definitions with support to automated analysis allowing to extract implicit information from them and their relationships with the BP. This information can assist process analysts in the definition and evolution of PPIs, as well as in the evaluation and optimization of the BPs associated.

In this paper we address this challenge by providing a twofold contribution. On the one hand, we present the PPINOT metamodel of which a preliminary version was introduced at [4]. On the other hand we provide an automatic semantic mapping from the metamodel to Description Logics (DLs) that allows the implementation of design-time analysis operations to identify the relationships between PPIs and BP elements, in such a way that DL reasoners' facilities can be leveraged. This design-time analysis provide information about the business process elements that may have an influence on a PPI and the BP elements that must be measured to calculate the PPIs.

The main benefits of our contribution can be summarised as follows:

**Unambiguity and expressiveness.** The PPINOT metamodel allows the definition of all of the PPIs found in the literature review and has been tested

\* This work has been published in the Information Systems Journal 38(4), 470-490 (2013). It has been partially supported by the European Commission (FEDER), Spanish Government under the CICYT projects SETI (TIN2009-07366) and TAPAS (TIN2012-32273); and projects THEOS (TIC-5906) and ISABEL (P07-TIC-2533) funded by the Andalusian local Government.

in several real scenarios so that it can provide a solid basis for defining PPIs in any organisation.

**Understandability by non-technical users.** PPINOT metamodel is at the same level of abstraction than business processes rather than at a more technical level such as information systems logs, hence it is easier to understand by process managers and employees.

**Automated design-time support.** A set of design-time analysis operations have been provided. They extract information from the relationships between PPIs and BP elements, and are automated by the aforementioned semantic mapping to DL.

**Traceability with BPs.** A PPI defined using the PPINOT metamodel can always be traced back to the BP elements used in its definition, allowing so the implementation of a tool that automatically instruments an open source BPMS to compute the PPI values, or of the analysis operations introduced above.

**Independence of the BP language.** Though a binding to use it with BPMN is described in this paper, PPINOT metamodel can be used with any BP modelling language.

To validate the usefulness of the PPINOT metamodel, we have developed a software tool called the PPINOT tool suite that uses the PPINOT metamodel at its core to offer: (1) two complementary tools to define PPIs, namely a graphical editor to define them together with their corresponding BPs and a templates-based editor that uses natural language patterns [5] to allow a textual definition of PPIs; (2) a design-time analyser of PPIs that implements the introduced design-time analysis operations; (3) a PPI instrumenter that gathers the required information to compute their values, and (4) a reporter that shows these values. Furthermore, we have applied our proposal in several real scenarios, namely: the IT Department of the Andalusian Health Service, the Information and Communication Service of the University of Seville, and the Consejería de Justicia y Administración Pública of the Andalusian Local Government.
